Identity distances and interplanar spacings.	265
Standard [111] stereographic projection for directions in Mercury.	266
Standard (111) stereographic projection for planes in Mercury.	267

This volume contains crystallographic angles for the four metals which have rhombohedral structures, namely, mercury, bismuth, antimony and arsenic. All planes and directions with Miller indices from $\bar{3}$ to 3 have been included.

Angles of the form $A^{\wedge}B$ are given, where A and B represent the indices of either planes or directions, so that for every pair $A^{\wedge}B$ three angles have been obtained; those between planes and planes, directions and directions, and plane normals and directions. There are 145 sets of indices with individual components in the range $\bar{3}$ to 3, but it was not necessary to calculate $(145)^2 \times 3$ angles for each metal as this would have produced much repetition. Suitable permutations of indices make it necessary for only $(33 \times 145) \times 3$ angles to be given. i.e., 33 A's and 145 B's have been used.

The angles between one A and the 145 B's for a given metal are grouped together on two pages of the tables, and these are followed on the next two pages by the angles between the next A and the 145 B's. The order in which indices A appear in the tables is given in the index of A's on page (vi). This index contains the numbers of the pages in the volume on which the A's occur for each metal.

At the top of each page containing a new A, the metal "code letter" is printed, the letters being H, B, S and A for mercury, bismuth, antimony and arsenic respectively. This letter is followed by the 3 indices representing A. Beneath this heading are 145 rows, the 3 indices representing B being printed at the beginning of each row. Each row contains

direction B, and the third the angle between the normal to plane A and direction B. Hence a typical page in the tables appears thus:-

(Code letter) H	(Indices A) $u_1 u_2 u_3$			
$v_1 v_2 v_3$	θ_1	θ_2	θ_3	
$v_1^1 v_2^1 v_3^1$	θ_1^1	θ_2^1	θ_3^1	
$\vdots$	$\vdots$	$\vdots$	$\vdots$	
(Indices B)	(Plane ^ Plane)	(Direction ^ Direction)	(Plane normal ^ Direction)	

The tables contain only planes and directions with one negative component in their indices. To use them for planes or directions with two negative components, multiply each component by -1 and subtract the angle given in the tables for the new indices from 180° . For example, the angle between directions $[111]$ and $[\bar{1}\bar{2}\bar{3}]$ is 180° minus the angle between $[111]$ and $[12\bar{3}]$. If both sets of indices have to be multiplied by -1, the required angle will be the one given in the tables. To use the tables for planes and directions with indices whose components are in a different order to those given, firstly change the order of one set so that it is the same as one of the A's; then change the order of the components in the second set in a similar way. For example, the angle between $[201]$ and $[321]$ is the same as the angle between $[012]$ and $[213]$.

The metals can be considered to have face-centred rhombohedral structures of axial angle α , but the primitive cells are simple rhombohedrons of axial angle β . See figure on

given on page (vii). The structure of bismuth, antimony and arsenic can also be considered to be hexagonal, and references for values of a and c are given on page (vii). (A figure showing the hexagonal and primitive rhombohedral cells is given on page 69 of "X-ray Crystallography" by M.J. Buerger, Wiley (New York), 1942. Transformations for planes and directions are also given).

The indices used in this work refer to the face-centred rhombohedral cell. The Miller indices of the planes and directions in the primitive rhombohedral structure and the Miller-Bravais indices of planes and directions in the hexagonal structure corresponding to those of indices A in the face-centred rhombohedral structure are given in the table on page (xi). The matrix equations for these transformations are also given.

Although the structures of the metals are close to cubic, the tables indicate that the deviation from orthogonality can result in considerable differences between the three sets of angles for each metal. Only the $[111]$ direction, and directions contained in the (111) plane are perpendicular to planes with the same indices. Standard $[111]$ and (111) stereographic projections for directions and planes in mercury are given at the end of the volume.

The table on page (265) gives the "identity distance", I , along the direction with indices A for each metal, i.e., the distance between atoms along that direction. The interplanar spacing, D , between planes with indices A is also given. The cell edge, a , is taken as the unit length in both

formulae used to calculate the angles are also found on page (viii), and were programmed, using autocode, for the Ferranti Sirius computer of the Battersea College of Technology. The total computing time for each metal was approximately 7 hrs. The tables were printed directly from the output tape of the computer, and any undetected errors are probably due to teleprinter faults. The author would be appreciative of notification if any such errors are discovered.

The author's thanks are due to Dr. A. G. Crocker for suggesting this work and for valuable discussions and ideas. Thanks are also due to F. Heckscher and M. J. Bevis for discussions, the latter especially for his help during the long hours of computing, and to the D.S.I.R. for the award of a research grant to the author.

The angle θ_1 between planes of indices $(h_1 k_1 l_1)$ and $(h_2 k_2 l_2)$ is given by: $\cos \theta_1 =$

$$\frac{(h_1 h_2 + k_1 k_2 + l_1 l_2)(1 + \cos \alpha) - [h_1(k_2 + l_2) + k_1(h_2 + l_2) + l_1(h_2 + k_2)] \cos \alpha}{A_1 A_2}$$

where $A_i = \left[(h_i^2 + k_i^2 + l_i^2)(1 + \cos \alpha) - 2(h_i k_i + h_i l_i + k_i l_i) \cos \alpha \right]^{\frac{1}{2}}$

The angle θ_2 between directions $[u_1 v_1 w_1]$ and $[u_2 v_2 w_2]$ is given by: $\cos \theta_2 =$

$$\frac{(u_1 u_2 + v_1 v_2 + w_1 w_2) + [u_1(v_2 + w_2) + v_1(u_2 + w_2) + w_1(u_2 + v_2)] \cos \alpha}{B_1 B_2}$$

where $B_i = \left[(u_i^2 + v_i^2 + w_i^2) + 2(u_i v_i + u_i w_i + v_i w_i) \cos \alpha \right]^{\frac{1}{2}}$

The angle θ_3 between the normal to plane (hkl) and direction $[uvw]$ is given by: $\cos \theta_3 =$

$$\frac{(hu + kv + lw)(1 + \cos \alpha - 2 \cos^2 \alpha)^{\frac{1}{2}}}{A B}$$

The "identity distance" I along direction $[uvw]$ is given by:

$$I = \left[(u^2 + v^2 + w^2) + 2 \cos \alpha (uv + uw + vw) \right]^{\frac{1}{2}}$$

(There is a multiplying factor $\frac{1}{2}$ if the sum of the components u, v and w is even.)

The perpendicular distance D between planes $(h k l)$ is given by:

$$D^{-1} = \left[\frac{(h^2 + k^2 + l^2)(1 + \cos \alpha) - 2 \cos \alpha (hk + hl + kl)}{(1 + \cos \alpha - 2 \cos^2 \alpha)} \right]^{\frac{1}{2}}$$

(D is multiplied by $\frac{1}{2}$ if any of the components h, k or l are even).

We represent planes and directions by row matrices and column matrices respectively.

The matrices representing the transformations of indices from face-centred rhombohedral to primitive rhombohedral for directions and planes are

$$\begin{pmatrix} \bar{1} & 1 & 1 \\ 1 & \bar{1} & 1 \\ 1 & 1 & \bar{1} \end{pmatrix} \quad \text{and} \quad \begin{pmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{pmatrix} \quad \text{respectively.}$$

For example, the direction $[012]$ in the face-centred structure becomes the $[31\bar{1}]$ direction in the primitive structure since $\begin{pmatrix} \bar{1} & 1 & 1 \\ 1 & \bar{1} & 1 \\ 1 & 1 & \bar{1} \end{pmatrix} \begin{pmatrix} 0 \\ 1 \\ 2 \end{pmatrix} = \begin{pmatrix} 3 \\ 1 \\ \bar{1} \end{pmatrix}$, and the plane

(012) becomes the plane (321) since $(012) \begin{pmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{pmatrix} = (321)$.

The sense of the lattice vectors in these structures is shown in the figure on page (xiii).

The transformation from face-centred rhombohedral to hexagonal is not so simple if directions and planes in the hexagonal system are represented by the Miller-Bravais indices. However, in this system the third of the four indices is the negative sum of the first two and hence becomes redundant. The transformation matrices from face-

centred rhombohedral to hexagonal are $\frac{1}{3} \begin{pmatrix} \bar{2} & 2 & 0 \\ 0 & \bar{2} & 2 \\ 1 & 1 & 1 \end{pmatrix}$ and $\begin{pmatrix} \bar{1} & 0 & 2 \\ 1 & \bar{1} & 2 \\ 0 & 1 & 2 \end{pmatrix}$

for directions and planes respectively. Hence, the direction $[112]$ in the face-centred structure becomes the $\frac{2}{3} [01\bar{1}2]$ direction in the hexagonal system since

$$\frac{1}{3} \begin{pmatrix} \bar{2} & 2 & 0 \\ 0 & \bar{2} & 2 \\ 1 & 1 & 1 \end{pmatrix} \begin{pmatrix} 1 \\ 1 \\ 2 \end{pmatrix} = \frac{1}{3} \times \begin{pmatrix} 0 \\ 2 \\ 4 \end{pmatrix} = \frac{2}{3} [01\bar{1}2], \quad \text{and}$$

the plane (123) becomes the plane $(11\bar{2}12)$

The following table gives the planes and directions in the primitive rhombohedral and hexagonal structures corresponding to those of indices A in the face-centred structure.

001	[11 $\bar{1}$]	(110)	$\frac{1}{3}$	[0 2 $\bar{2}$ 1]	(0 1 $\bar{1}$ 2)

Antimony.	133
Arsenic.	199
Identity distances and interplanar spacings.	265
Standard [111] stereographic projection for directions in Mercury.	266
Standard (111) stereographic projection for planes in Mercury.	267

This volume contains crystallographic angles for the four metals which have rhombohedral structures, namely, mercury, bismuth, antimony and arsenic. All planes and directions with Miller indices from $\bar{3}$ to 3 have been included.

Angles of the form $A^{\wedge}B$ are given, where A and B represent the indices of either planes or directions, so that for every pair $A^{\wedge}B$ three angles have been obtained; those between planes and planes, directions and directions, and plane normals and directions. There are 145 sets of indices with individual components in the range $\bar{3}$ to 3, but it was not necessary to calculate $(145)^2 \times 3$ angles for each metal as this would have produced much repetition. Suitable permutations of indices make it necessary for only $(33 \times 145) \times 3$ angles to be given. i.e., 33 A's and 145 B's have been used.

The angles between one A and the 145 B's for a given metal are grouped together on two pages of the tables, and these are followed on the next two pages by the angles between the next A and the 145 B's. The order in which indices A appear in the tables is given in the index of A's on page (vi). This index contains the numbers of the pages in the volume on which the A's occur for each metal.

At the top of each page containing a new A, the metal "code letter" is printed, the letters being H,B,S and A for mercury, bismuth, antimony and arsenic respectively. This letter is followed by the 3 indices representing A. Beneath this heading are 145 rows, the 3 indices representing B being printed at the beginning of each row. Each row contains

direction B, and the third the angle between the normal to plane A and direction B. Hence a typical page in the tables appears thus:-

(Code letter)	(Indices A)			
H	$u_1 u_2 u_3$			
$v_1 v_2 v_3$	e_1	e_2	e_3	
$v_1^1 v_2^1 v_3^1$	e_1^1	e_2^1	e_3^1	
$\vdots$	$\vdots$	$\vdots$	$\vdots$	
(Indices B)	(Plane ^ Plane)	(Direction ^ Direction)	(Plane normal ^ Direction)	

The tables contain only planes and directions with one negative component in their indices. To use them for planes or directions with two negative components, multiply each component by -1 and subtract the angle given in the tables for the new indices from 180° . For example, the angle between directions $[111]$ and $[\bar{1}\bar{2}\bar{3}]$ is 180° minus the angle between $[111]$ and $[12\bar{3}]$. If both sets of indices have to be multiplied by -1, the required angle will be the one given in the tables. To use the tables for planes and directions with indices whose components are in a different order to those given, firstly change the order of one set so that it is the same as one of the A's; then change the order of the components in the second set in a similar way. For example, the angle between $[201]$ and $[321]$ is the same as the angle between $[012]$ and $[213]$.

The metals can be considered to have face-centred rhombohedral structures of axial angle α , but the primitive cells are simple rhombohedrons of axial angle β . See figure on

given on page (vii). The structure of bismuth, antimony and arsenic can also be considered to be hexagonal, and references for values of a and c are given on page (vii). (A figure showing the hexagonal and primitive rhombohedral cells is given on page 69 of "X-ray Crystallography" by M.J. Buerger, Wiley (New York), 1942. Transformations for planes and directions are also given).

The indices used in this work refer to the face-centred rhombohedral cell. The Miller indices of the planes and directions in the primitive rhombohedral structure and the Miller-Bravais indices of planes and directions in the hexagonal structure corresponding to those of indices A in the face-centred rhombohedral structure are given in the table on page (xi). The matrix equations for these transformations are also given.

Although the structures of the metals are close to cubic, the tables indicate that the deviation from orthogonality can result in considerable differences between the three sets of angles for each metal. Only the $[111]$ direction, and directions contained in the (111) plane are perpendicular to planes with the same indices. Standard $[111]$ and (111) stereographic projections for directions and planes in mercury are given at the end of the volume.

The table on page (265) gives the "identity distance", I , along the direction with indices A for each metal, i.e., the distance between atoms along that direction. The interplanar spacing, D , between planes with indices A is also given. The cell edge, a , is taken as the unit length in both

formulae used to calculate the angles are also found on page (viii), and were programmed, using autocode, for the Ferranti Sirius computer of the Battersea College of Technology. The total computing time for each metal was approximately 7 hrs. The tables were printed directly from the output tape of the computer, and any undetected errors are probably due to teleprinter faults. The author would be appreciative of notification if any such errors are discovered.

The author's thanks are due to Dr. A. G. Crocker for suggesting this work and for valuable discussions and ideas. Thanks are also due to F. Heckscher and M. J. Bevis for discussions, the latter especially for his help during the long hours of computing, and to the D.S.I.R. for the award of a research grant to the author.

The angle θ_1 between planes of indices $(h_1 k_1 l_1)$ and $(h_2 k_2 l_2)$ is given by: $\cos \theta_1 =$

$$\frac{(h_1 h_2 + k_1 k_2 + l_1 l_2)(1 + \cos \alpha) - [h_1(k_2 + l_2) + k_1(h_2 + l_2) + l_1(h_2 + k_2)] \cos \alpha}{A_1 A_2}$$

where $A_i = [(h_i^2 + k_i^2 + l_i^2)(1 + \cos \alpha) - 2(h_i k_i + h_i l_i + k_i l_i) \cos \alpha]^{\frac{1}{2}}$

The angle θ_2 between directions $[u_1 v_1 w_1]$ and $[u_2 v_2 w_2]$ is given by: $\cos \theta_2 =$

$$\frac{(u_1 u_2 + v_1 v_2 + w_1 w_2) + [u_1(v_2 + w_2) + v_1(u_2 + w_2) + w_1(u_2 + v_2)] \cos \alpha}{B_1 B_2}$$

where $B_i = [(u_i^2 + v_i^2 + w_i^2) + 2(u_i v_i + u_i w_i + v_i w_i) \cos \alpha]^{\frac{1}{2}}$

The angle θ_3 between the normal to plane (hkl) and direction $[uvw]$ is given by: $\cos \theta_3 =$

$$\frac{(hu + kv + lw)(1 + \cos \alpha - 2 \cos^2 \alpha)^{\frac{1}{2}}}{A B}$$

The "identity distance" I along direction $[uvw]$ is given by:

$$I = [(u^2 + v^2 + w^2) + 2 \cos \alpha (uv + uw + vw)]^{\frac{1}{2}}$$

(There is a multiplying factor $\frac{1}{2}$ if the sum of the components u, v and w is even.)

The perpendicular distance D between planes $(h k l)$ is given by:

$$D^{-1} = \left[\frac{(h^2 + k^2 + l^2)(1 + \cos \alpha) - 2 \cos \alpha (hk + hl + kl)}{(1 + \cos \alpha - 2 \cos^2 \alpha)} \right]^{\frac{1}{2}}$$

(D is multiplied by $\frac{1}{2}$ if any of the components h, k or l are even).

We represent planes and directions by row matrices and column matrices respectively.

The matrices representing the transformations of indices from face-centred rhombohedral to primitive rhombohedral for directions and planes are

$$\begin{pmatrix} \bar{1} & 1 & 1 \\ 1 & \bar{1} & 1 \\ 1 & 1 & \bar{1} \end{pmatrix} \quad \text{and} \quad \begin{pmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{pmatrix} \quad \text{respectively.}$$

For example, the direction $[012]$ in the face-centred structure becomes the $[31\bar{1}]$ direction in the primitive structure since $\begin{pmatrix} \bar{1} & 1 & 1 \\ 1 & \bar{1} & 1 \\ 1 & 1 & \bar{1} \end{pmatrix} \begin{pmatrix} 0 \\ 1 \\ 2 \end{pmatrix} = \begin{pmatrix} 3 \\ 1 \\ \bar{1} \end{pmatrix}$, and the plane

(012) becomes the plane (321) since $(012) \begin{pmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{pmatrix} = (321)$.

The sense of the lattice vectors in these structures is shown in the figure on page (xiii).

The transformation from face-centred rhombohedral to hexagonal is not so simple if directions and planes in the hexagonal system are represented by the Miller-Bravais indices. However, in this system the third of the four indices is the negative sum of the first two and hence becomes redundant. The transformation matrices from face-centred rhombohedral to hexagonal are $\frac{1}{3} \begin{pmatrix} \bar{2} & 2 & 0 \\ 0 & \bar{2} & 2 \\ 1 & 1 & 1 \end{pmatrix}$ and $\begin{pmatrix} \bar{1} & 0 & 2 \\ 1 & \bar{1} & 2 \\ 0 & 1 & 2 \end{pmatrix}$ for directions and planes respectively. Hence, the direction $[112]$ in the face-centred structure becomes the $\frac{2}{3} [01\bar{1}2]$ direction in the hexagonal system since

$$\frac{1}{3} \begin{pmatrix} \bar{2} & 2 & 0 \\ 0 & \bar{2} & 2 \\ 1 & 1 & 1 \end{pmatrix} \begin{pmatrix} 1 \\ 1 \\ 2 \end{pmatrix} = \frac{1}{3} \times \begin{pmatrix} 0 \\ 2 \\ 4 \end{pmatrix} = \frac{2}{3} [01\bar{1}2], \quad \text{and}$$

the plane (123) becomes the plane $(11\bar{2}12)$

The following table gives the planes and directions in the primitive rhombohedral and hexagonal structures corresponding to those of indices A in the face-centred structure.

001	$[11\bar{1}]$	(110)	$\frac{1}{3}$	$[0\ 2\ \bar{2}\ 1]$	(0 1 $\bar{1}$ 2)
